

ABSTRACT OF THE DISCLOSURE

In a service providing system, a live-distribution service for live-distributing contents supplied according to a reservation, and a chat service for providing the use of a chat space corresponding to the reservation for live distribution are provided. After the live distribution finishes, a communication server sends the whole or a part of the contents of chatting performed in the chat space corresponding to the reservation for the live distribution, to a personal computer. With this, even if the user of the personal computer, who supplies the contents, could not participate in a chat with a user of another personal computer while capturing the contents, for example, the user of the personal computer can check the contents of the chat later.
